## Digital Multifunctional Power Instrument(LED)

## Multifunctional Power Instrument (LED)

Operational Instruction Manual

Chapter 1. General Introduction
Multifunctional power instrument (instrument for short below) is an electronic measuring instrument developed for the measuremen of power all parameters.Measurement of the parameters are displayed on the 5 display. The instrument can measure and manage more than 50 parameters at the same timothy input network, current and voltage ratio can be programmed. Provide the phase voltage three phase four line), line voltage(three phase three wire), the minimum and maximum values of the phase current and the total current. At the same time, provide the phase current, total current, total active power, total reactive power and the total apparent power demand value. The instrument has four channels switching value input,two channels electric energy pulse output, RS485 communication output,and can extended four channels switching value output or four channels analog quantity output.The instrument can directly replace conventional power transmitter, measuring instrument, electric energy meter and related auxiliary unit
Chapter 2. Product Function

## Ordinary function

Phase voltage(VL_N): UA, UB, UC
Line voltage(VL L): UAB, UBC, UCA
Phase current and total current: IA, IB, IC, TI( $\Sigma \mathrm{A})$
Active power: phase active power and total active power: $\mathrm{PA}, \mathrm{PB}, \mathrm{PC}, \mathrm{TP}(\Sigma \mathrm{W})$
Reactive power: phase reactive power and total reactive power:QA, QB, QC,TQ( $\Sigma v a r)$
Apparent power: phase apparent power and total apparent power:SA,SB,SC,TS( $\sum \mathrm{VA}$
Power factor: phase power factor(cos $\Phi$ ):PFA,PFB,PFC
-Active electric energy(Wh):I-AE(positive active electric energy),E-AE(opposite active electric energy)
-Reactive electric energy(varh):I- E (positive reactive electric energy),E-rE(opposite reactive electric energy)
-Frequency(Hz):FR
-The average value of phase voltage(VL N) and line voltage(VL L):Average PU,Avergae LU
-The maximum and minimum value of phase voltage phase current and total current:UAmax, UBmax, UCmax, IAmax, IBmax, ICmax Imax, UAmin, UBmin, UCmin, IAmin, IBmin, ICmin. If the measured value is less than a minimum of record values, measured value is ecorded as a new minimum value; If more than a maximum recorded value, measured value is recorded as a new maximum value The demand value ( $M$ ) of phase current ,total current,total active power, total reactive power and total apparent power:Demand_IA, Demand_IB,Demand_IC,Demand_TI,Demand_TP,Demand_TQ,Demand_TS.Demand value is the average of measured values for demand period, is the mean of measured values, and is updated if new demand value is greater than old.

Extended function

- 4 channels analog quantity output

4 channels switch value output
4 channels switch value input

Chapter 3. Technical Parameters

| Technical parameters |  |  | Index |
| :---: | :---: | :---: | :---: |
| Input |  | Net work | Three-phase three-wire, three-phase four-wire |
|  | Voltage | Rated value | AC 100V,400V |
|  |  | Over load | Consistent:1.2 times instantaneous:2 times /30s |
|  |  | Comsumption | $<0.5 \mathrm{VA}$ (each phase) |
|  |  | Impedance | >500k $\Omega$ |
|  | Current | Rated value | AC 1A, 5A |
|  |  | Over load | Consistent:1.2 times instantaneous:2 times /1s |
|  |  | Impedance | $<2 \mathrm{~m} \Omega$ |
|  |  | Frequency | $45 \sim 65 \mathrm{~Hz}$ |
| Output | Electric energy | Output mode | Two-channel open-collector optical coupling pulse output |
|  |  | Pluse constant | Active 3200imp/kwh Reactive 3200imp/kvarh |
|  |  | Start | On the condition of rated voltage, reference frequency and $\cos \varphi=1.0$, when load operational current is 0.001 ln , it can start and measure the electric energy continuously. |

| Output | Electric energy | Creep | When exerting $115 \%$ rated voltage and no current in the current circuitry, the instrument is with no electric energy accumulation and pulse output. |
| :---: | :---: | :---: | :---: |
|  | Communication | Output mode | RS485 |
|  |  | Protocol | MODBUS_RTU |
|  |  | Baud rate | 1200,2400,4800, 9600 |
|  | Analog quantity | Channel quantity | 4 channels |
|  |  | Output mode | $0 \sim 20 \mathrm{~mA}, 4 \sim 20 \mathrm{~mA}$ |
|  |  | Load ability | s400W |
|  | Switching value | Channel quantity | 4 channels |
|  |  | Output mode | Normally open relay contact output |
|  |  | Contact capability | AC 240V/2A |
|  | Switching value input |  | Four channel dry contact input modes |
|  | Display mode |  | LED(Red) |
| Measuring accuracy | Voltage, current |  | $\pm(0.5 \%$ FS + one digit) |
|  | Active power, reactive power |  | $\pm(0.5 \% \mathrm{FS}+$ one digit) |
|  | Frequency |  | $\pm 0.1 \mathrm{~Hz}$ |
|  | Power factor |  | $\pm 0.01 \mathrm{PF}$ |
|  | Active energy |  | $\pm 0.5 \%$ (only for reference, not for meterage) |
|  | Reactive energy |  | $\pm 1.0 \%$ (only for reference, not for meterage) |
| Sourse | Scope |  | AC $220 \mathrm{~V}, 50 / 60 \mathrm{~Hz}$ |
|  | Consumption |  | <5VA |
| Safety | Withstand voltage | Input and sourse | >2kv50Hz/1 min |
|  |  | Input and output | $>1 \mathrm{kv} 50 \mathrm{~Hz} / 1$ min |
|  |  | Output and sourse | >2kv50Hz/1 min |
|  | Insulating resistance |  | Any two of input, output, source, casing>20M |
| Environment | Temperature |  | Operation:-10~50 ${ }^{\circ} \mathrm{C}$ |
|  |  |  | Storage:-25~70 ${ }^{\circ} \mathrm{C}$ |
|  | Humidity |  | $\leq 85 \%$ RH, free of wet and corrosive gas |
|  | Elevation |  | s3000m |

## Chapter 4. Program and usage

4.1 Panel description

(2)
4. 2 Description of key function

Average key: Under the measuring display mode, it is used to switch between VL_N and Hz;Under the programming mode,moves the cursor to the left one.

QUp key:Under the measuring display mode, it is used to switch between VL_L and VL_N; Under the programming mode, it is used for degressive increase of parameter value or inter the next menu.

SET Set key : Under the measuring display mode, it is used to switch between Maximum value, Minimum value,Demand value and Realtime measuring value;Press this key to enter the program mode. After input the correct password(factory password 0001)"Code" prompted by the instrument, it is capable of programming and setting. Under the programming mode, it is used to return to the previous menu when choosing the menu items. The instrumen willing display"SAVE-YES" when it return to the measuring display mode from the programming mode, then press the this key to save and qiut.
$\square$ Down key:Under the measuring display mode, it is used to switch between VL_N and VL_L;Under the programming mode, it is used for progressive decrease of parameter value or inter the previous menu.
$\square$ Total key : Under the measuring display mode, it is used to switch between $\Sigma \mathrm{W}$ and $\Sigma \mathrm{var} ;$ Under the programming mode, it is used to return to previous menu and not storing parameters.
4.3 Display mode description
4.3.1 Press Up key and Down key can respectively display power parameters for $\mathrm{VL} \_\mathrm{N}, \mathrm{A}, \Sigma \mathrm{A}, \mathrm{W}, \mathrm{var}, \mathrm{VA}, \cos \Phi, \mathrm{Wh}$, varh, VL_L, Display for the $A$ window displays the $A$ parameter, $B$ window displays the $B$ parameter, $C$ window display $C$ parameters (except $\Sigma \mathrm{A}$, Wh and varh).
As the following picture shows

The left picture shows
A phase current is $1 \mathrm{~A}=5.000 \mathrm{~A}$
B phase current is $I B=5.001 \mathrm{~A}$
C phase current is $\mathrm{Ic}=4.999 \mathrm{~A}$
(VL-N, W indicator lamp is lit up It is the current value for the phase voltage, phase active power and other parameters when VL-N, W indicator lamp is litup )

Under the total current display mode, only the C window displays the total current. At the same time, the A window displays status of switching value input.As the following picture shows, thousand, hundred, ten, a corresponding to the fourth, third, second, first switching value input state, " 0 " means the external switch off, " 1 " means the external switch on; The $B$ window displays status of switching value output,As the following picture shows, thousand, hundred, ten, a corresponding to the fourth, third, second, first switching value output state, "0" means the external switch off, "1" means the external switch on

The display status of switching value input, switching value output, and total current.
Under the active electric energy and reactive electric energy display state, A window displays the sign of positive or negative, B and C window display the electric energy value. As the following picture shows, C window corresponding thousand , hundred, ten, a bits of parameters, $B$ window corresponding million, one hundred thousand, ten thousand bits of parameters.

Positive active electric energy
(It is opposite active electric energy
when $A$ window displays EP-)

Positive reactive electric energy
(It is opposite reactive electric energy
when A window displays Eq -)
4.3.2 Use Total key can select respectively the current display parameters for $\Sigma \mathrm{W}, \Sigma$ var, $\Sigma$ VA,
it is displayed in the total window, as the following picture shows

The left picture shows
Three-phase total active power: $\mathrm{Pt}=3.300 \mathrm{KW}$

Total active power value display
(It is total reactive power value or total apparent power value when the $\Sigma$ var or $\Sigma$ VA indicator is lit up )
4.3.3 Use Total key can select respectively the current display parameters for Avergae_VL_N,Average_VL_Lor Frequency, it is displayed in the average window, as the following picture shows

|  |  |
| :---: | :---: |
|  |  |

The left picture shows
Three-phase average phase voltag
Average_PU=220.0V
4.3.4 Press Set button to view the maximum, minimum and demand value. If the current display objects provide maximum value,minimum value and demand value, them are displayed in order of evaluation when press the Set key. If the current display objects not provide maximum value, minimum value and demand value,real-time measurement values are displayed continuously when press the Set key. As the following picture shows:

| $\stackrel{\text { L1 }}{0} \mathrm{~L} \mathrm{~L}^{\text {L }} \mathrm{O}$ |  |
| :---: | :---: |
|  |  |
| $\mathrm{K}_{\mathrm{KO}}^{\mathrm{KO} .1,7}$ | cova |
|  | , |
| $\left.\begin{array}{\|l\|} \text { ko } \\ \text { MO } \end{array} \right\rvert\,$ |  |
| ко |  |

The left picture shows
A Phase minimum current value:IAmin=2. 104A
A Phase minimum current value: $I B \min =2.108 \mathrm{~A}$ A Phase minimum current value:ICmin=2. 107A Three-phase minimum reactive power value
Qrmin=345Var
Note: Start maximum value and munimum value detecting function before viewing maximum value and munimum value
It is the minimum value of phase voltage or total current when the VL_N or $\Sigma$ VA indicator is lit up. the maximum value of parameters when the H indicator is lit up.

The left picture shows:
The demand value of total current:
Demand_TI=15. 09KA
The demand value of total active power:
Demand_TP=3. 430KW
Note: view the demand value at least need to
wait for a demand cycle.

### 4.4 Menu framework

4．5 Menu significations
Under the programmable mode，five menu setting items including of setting（SEt），input（inPt），communication（Conn），switching value output（do1－4），annlog quantity（Ao1－4），modify password（CodE）and LED display hierarchical menuframework management are provided in this instrument．Row 1 displays the first－tier menu；row 2 displays the second－tier menus；row 3 displays the parameter value．

| First－tier menu | Second－tier menu | Parameter value | Description |
| :---: | :---: | :---: | :---: |
| 「ロロE |  | 0～9999 | Prompt the input programmable password is codE， and can only enter the programmable mode with correct password．（Factory CodE：0001） |
| らEL | $\square 15 \square$ | 0～12 | Select display mode＂diSP＂ |
|  | －1． | 1～60 | Demand Cycle（unit：min，default： 15 min ） |
|  | らヒ．L | YES／NO | Pressing＂Set key＂to start the maximum and minimum detection function |
|  | Lir．n | YES／NO | Pressing＂Set key＂to clear the maximum and Minimum data of the instrument |
|  | Lir．a | YES／NO | Pressing＂Set key＂to clear the demand data of the instrument |
|  | ELTE | YES／NO | Pressing＂Set key＂to clear the electric energy data of the instrument |
| 1 ก．ワL | のEL | $\begin{aligned} & \text { n. } 3.4 \\ & \text { n. } 3.3 \end{aligned}$ | Select input network＂nEt＂，n．3．3：three－phase three－wire n．3．4：three－phase four－wire |
|  | H．5LE | $\begin{aligned} & 400 \mathrm{~V} \\ & 100 \mathrm{~V} \end{aligned}$ | Select measuring range of voltage：400V or 100 V |
|  | 1.55 | 5A／1A | Select measuring range of current：5A or 1A |
|  | PL | 1～9999 | Set multiplying power of voltage transformer （Primary value／second value of voltage transformer） |
|  | LE | 1～9999 | Set multiplying power of current transformer （Primary value／second value of current transformer） |
| Eロッп | $5 \pi$ | 1～247 | Set RS485 communication address＂Sn＂ |
|  | ロ Rid | $\begin{aligned} & 9600 \\ & 4800 \end{aligned}$ | Select communication baud rate＂bAud＂：1200，2400，4800 or 9600 |

|  | $\cdots-\beth$ | 0～9999 | Input new code second time |

## 4．6 Programming operation examples

The measuring range of instruments has been set as the same parameters provided by users at thefactory．Users should check if the input network，voltage／current measuring range and transformer multiplying power are consistent with the actual input again before use

4．6．1 Start the maximum and minimum detection function

4．6．2 Set current rate，change the rate from 1 （ $5 / 5 \mathrm{~A}$ ）to $100(500 / 5 \mathrm{~A}$ ）

4．6．3 clear the electric energy data

Chapter 5. Installment and wiring
5.1 Shape and cutout hole dimension(unit: mm )

| Shape | Panel dimension |  | Case dimension |  |  | Cutouthole dimension |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | W | H | W | H | D | W | H |
| $96 \times 96$ Square | 96 | 96 | 90 | 90 | 83 | 92 | 92 |

5.2 Method of installation

Choose the corresponding hole cutout dimension from the table above, make a hole in the installation screen, insert the instruments into the hole, place the four clamping pieces into the clamping holder and push and tighten them by hand.
5.3 Wiring instructions

5.3.1 Terminal arrangement and function declaration of instrument(please accord to the one of instrument case) Auxiliary power supply (POWER): AC $220 \mathrm{~V}, 50 / 60 \mathrm{~Hz}$ (Can customize other values)
Electrical quantity signal input: $\mathrm{A}, \mathrm{B}$ and C three-phase AC current or voltage signal input port, and $\mathrm{I}^{*}$ is current live wire. When connect, please ensure the phase sequence and polarity of input signal respond with the terminals to avoid indicating value error. When the voltage is higher than the rated input voltage of the product, you should consider of using PT and installing fuse of 1 A at the voltage input port; while the current is higher than rated input current of the product, you should consider of using the exterior CT
5.3.2 Typical connection

Three-phase four-wire

Voltage $\leq 600 \mathrm{~V}$, input directly
Current $\leq 5 \mathrm{~A}$, input directly
Three-phase three-wire

Voltage 6000 V , input directly

volages600V, input directly

Voltages600V,input directly

Voltage> 600 V , input via PT Voltage $>600$ V, input via PT
Current $>5 A$, input via CT

Voltage $>600 \mathrm{~V}$, innut via PT
Current $>5$ A, input via CT
5.3.3 Energy signal output: $\mathrm{P}+$ is the active energy pulse output + port, $\mathrm{Q}+$ is the reactive energy pulse output + port, $\mathrm{P}-\mathrm{Q}-$ are the active/reactive electrical pulse output port. Output mode: open-collector optical coupling output; open-collector voltage $\mathrm{VCC} \leq 48 \mathrm{~V}$; current $\mathrm{I} \leq 550 \mathrm{~mA}$. The energy pulse output corresponds with these condary data. When measuring the primary energy, it needs to multiply the PT multiplying power and CT multiplying power to get the primary data.
5.3.4 RS485 communication connection

The instrument supplies a RS485 communication interface and applies MODBUS_RTU communication protocol (see the appendix). Up to thirty-two instrument can be connected in one communication line at one time. Each instrument should have the only communication address in the circuitry. Communication connection should use the shielded twisted paired with copper mesh, whose diameter should be not less than 0.5 mm . Communication line should be far away from the high-voltage cables or other highfield environment and the maximum transmission distance is 1200 m . The typical network connections are shown in the following figure and users can choose other suitable connect mode under specific conditions.
5.3.5 Switching value input(DI input): DI1~DI4 are 1~4 way dry contact input port, inside of the instrument there is power supply of +5 V . 5.3.6 Switching output and ananlog transmitting output: can support four-channel switching value output and four-channel analog transmitting output.

Chapter 6. Communication protocol
6.1 This series instrument are provided with Rs 485 communication interface and apply MODBUS_RTU communication protocol.

| Start | Address <br> code | Function <br> code | Data <br> sector | CRC code | End |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Halt time more <br> than three bytes | 1byte | 1byte | Nbyte | 2 byte | Halt time more <br> than three bytes |

6.2 Communication message transmitting process

When communication instructions transmit from master device to slave device, the slave device with corresponding address code receives communication orders and reads the massage according to functional code and relational requirements. After successful CRC verification without error, the corresponding operation will be conducted and the result (data), including address code, function code, data after execution and CRC verification code, is returned to the master device. In case of CRC verification failure, no message would be returned

## 6. 2. 1 Address code:

Address code is the first byte ( 8 bits) of each communication message frame, from 1 to 247 . Every slave device must have the only address code and only the slave device conforming to the address code can respond and return the message. When the slave device returns the message, all of the return data start with each address code. The address code sent by master device shows the receiving address of slave device, while the address code returned by slave device shows the returning slave address. The responding address code shows where the message comes from.
6. 2. 2 Function code

Function code is the second byte of each communication message frame. The master device sends and tells that what operation the slave device should carry out by means of function code. Then the slave device responds. The functional code returned by slave device is the same as the one sent by master device, which shows that slave device has responded the master device and carry out the relational operation. The instrument supports three function codes as following.

| Function code | Definition | Operation |
| :---: | :---: | :---: |
| 03 H | Read register | Read data of one or multiple resigister |

6.2.3 Data sector

Data sector are different following the different function code. These data could be numerical value, reference address and so on. For different slave device, the address and data information are different (There should be communication information table). The master device utilizes the communication order (Function code03H) to read and amend the data register of the slave device. The data length read out or written in should not exceed the effective range of the data register address once.
6.3 16-bit CRC verification code. Algorithm of CRC code:
6.3.1 Presetting a 16 -bit register to hex FFFF (namely 1 for all bits in binary system). The register is called CRC register
6.3.2 XORing the first 8 -bit binary data (the first byte of the communication message frame) with the low 8 -bit of 16 -bit CRC register, then storing the result in CRC register;
6.3.3 Right-shifting the register data by one bit (towards lower bit) and filling the highest bit with 0 , then verificationing the shift-out bit; 6.3.4 If the shift-out bit is 0 , repeat step 3 (right-shifting one more bit);If the shift-out bit is $1, \mathrm{XOR}$ the CRC register data with polynomial A001 (1010 00000000 0001);
6.3.5 Repeating step 3 and step 4 until all of the 8 -bit data have been processed after 8 right-shift operation
6.3.6 Repeating step 2 to step 5 to process the next byte of the communication message frame;
6.3.7 When calculation procedures of the first 5 bytes in the communication message frame are completed, the 16 -bit CRC verification code will be generated in the 16 -bit CRC register.
6.4 MODBUS_RTU address information form(the address is demonstrated with decimal system);

| Modbus address | Parameter code | Description | Explanation |
| :---: | :---: | :---: | :---: |
| Programming information |  |  |  |
| 0 | Code | Programming password | 1~9999 |
| 1 | xs | Display mode | 1byte |
| 1 | dz | Communication address | 1byte, 1~247 |
| 2 | PT | Multiplying power of potential transformer | 1~9999 |
| 3 | CT | Multiplying power of current transformer | 1~9999 |
| 4~6 |  | Reserve |  |
| Switch value output, analog quantity output |  |  |  |
| 7 | D01-Addr | Switch value output 1 | Chapter 8. Switch value module |
| 8 | DO1-Data | Swith value output 1 | Chapter 8. Swith value module |

Note: Description of data format
Data type "float" :four-byte floating data,apply IEEE-754 standard. The level code and mantissa express the magnitude of number. The description according to byte is as following:

| BYTE1 | BYTE2 | BYTE3 | BYTE4 |
| :---: | :---: | :---: | :---: |
| पПП\| |  |  |  |
| $\stackrel{\mid}{0}$ Exponent part |  |  |  |
|  | BYTE2 | BYTE3 | BYTE4 |
|  | प111111] |  | पП1111] |

## Mantissa part

Sign bit: SIGN=0 is poative, SIGN=1 is oppsite;
Exponent part: E=Exponent part-126;
Mantissa parts: $M=$ mantissa parts make up the highest bit is 1 ;
Data results: REAL=SIGN $\times 2^{\mathrm{E}} \times \mathrm{M} /(256 \times 65536)$.
For example: energy data which read from the address table to know electric energy
(positive active absorption) is: (Byte mode, compatible with the old standard) 92 ( 005 CH ) length of $4(0004 \mathrm{H})$. Master divice: 01 H 04 H 005 CH 0004 H 31 DBH
Slave divice: 0104 H 04 H 50800000 H EBH 6CH 50800000 is active energy, $\mathrm{EBH}, 6 \mathrm{CH}$ is low byte and high byte of CRC verification code)
Data representation: SIGN (sign bit = 0, positive), Exponent part: EX =A1H-126 = 35, Mantissa part: 080000 H
Electric energy: $2^{35} \times 80.0000 \mathrm{H} / 1000000 \mathrm{H}=17179869184 \mathrm{~Wh}=17179869 \mathrm{KWh}$
6.5 Communication messages Example

Read the data(function code: 03 H ): this function can make the user to get the terminal equipment acquisition, recording data and system parameter. The host one request the number of data collected not to be unlimited, but can not beyond the defined the address range.

For example,from one host the terminal equipment address is from 45(OCH) machine,read 3 data IA, IB,IC(Data frame date each address for 2 words, the IA word address start from 45 H data length is $6(06 \mathrm{H})$ words, word Word communication.

Inquire data frames(master device)
Inquire data frames(master device)

| Address <br> code | Function <br> code | Address of start register |  | Register quantity |  | CRC verification code |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | High byte | Low byte | High byte | Low byte | Low byte | High byte |  |

Indicate: $\mathrm{IA}=43556680 \mathrm{H}(213.4 \mathrm{~A}), ~ \mathrm{IB}=43203040 \mathrm{H}(160.1 \mathrm{~A}), ~ \mathrm{IC}=42 \mathrm{DDCC} 80 \mathrm{H}(110.8 \mathrm{~A})$
Chapter 7. The Electric Energy Pulse
The multifunctional network Power instrument provides active and reactive energy measurement, 2-way power pulse output and RS485 The digital interface completes energy data display and rhomboides. 3 rows of 12 digits LED active energy (positive) Reactive energy (inductive) 1 shows the measured data; open collector optocoupler relay power pulse (Resistance signal) achieves active power (positive) and reactive power (reverse) Remote, a remote computer using the final End, PIE, DI switch acquisition module, collecting instrument to achieve the total energy accumulated pulse measurement. The use of output or the output power accuracy test methods (national measurement procedures: the standard table Pulse error ratio method).
7.1 Electrical Characteristics: open collector voltage $\mathrm{VCC} \leq 48 \mathrm{~V}$, current $\mathrm{Lz} \leq 50 \mathrm{~mA}$.
7.2 Pulse constant: $3200 \mathrm{imp} / \mathrm{KWh}$. Its meaning is: When the instrument outputs a pulse when the accumulation of 1 KWh . Number 3200 , should be emphasized that 1 KWh 2 test for the electricity energy data, in PT, CT of the Case, the relative pulse data corresponding to the $\mathrm{N}-1$ measured power for the $1 \mathrm{KWh} \times \mathrm{PT} \times \mathrm{CT}$.
7.3 Application examples: PLC terminal using the pulse counting device, assuming that the length of time taken $T$ Set number of pulse into N , instrument input: $10 \mathrm{KV} / 100 \mathrm{~V}, 400 \mathrm{~A} / 5 \mathrm{~A}$, the period instrument. Table electricity accumulation: $\mathrm{N} / 3200 \times 100 \times 80$-degree power.

Positive active electric energy: 358891.08KWh

Positive reavtive electric energy: 8238.46Kvarh

## Chapter 8. Switch value module

The instrument offers 4 channels switch value input function and 4 channel opto-couple relay's switch value output function. 4 channels switch value input adopt the way of dry node resistor switch signal input. When it is connected for external part,the module DI via instrument switch input will collect the connecting information and display as 1 ; when it is disconnected for the external part, the module DI via instrument switch input will collect the disconnecting information and display as 0 . The switch value input module can not only collect and display the local switch information, but also can realize the remote transmitting function with the instrument's RS 485 digital connecting interface, it is function of "remote signalling" The switch value outpuf function of 4 channel opto-couple relay, can be used as the alarm caution, output function for protect controlling and so on. When the switch value is effective, relay output Sopening and switch value is closed the relay output will be closed also
Electric parameter:Switch value input DI:connecting resistor R>100K $\Omega$, Switch value output DO:AC $250 \mathrm{~V}, 0.1 \mathrm{~A}$
Register:DIO information register:this register show the status information for 4 channel switch value and 4 channel switch value output.

| DIO Register | BIT7 | BIT6 | BIT5 | BIT4 | BIT3 | BIT2 | BIT1 | BIT0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Switch port | DO4 | DO3 | DO2 | DO1 | DI4 | DI3 | DI2 | DI1 |
| Reposition | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The low 4 byte of the DIO register(BIT3,BIT2,BIT1, BITO) is the status information for switch value input.If the register display as 00000101 , it means the channel 3 and channel 1 for switch value input is closed;channel 4 and channel 2 is open.

The high 4 byte of the DIO register(BIT7,BIT6,BIT5,BIT4) is the status information for switch value output.If the register display as 1101000 , it means the channel 9,10 and 7 connect with channel 8,3 , and 4 ;disconnect with channel 5 and 6 . All the DIO information can be displayed on the LED screen of the instrument.
The parameter for each switch value alarm output value use the DOSI-3 continuous address space to save.For example:Channel 1 will use address:the 3 byte of $10,11,12$. The lowest byte(address 10)save the parameter of alarm output target.If the UA's low alarm parameter is 1 , high alarm is $129 ; 0$ means the remote controlling. The another two bytes(address 11 and 12) are the off-limit alarm parameter. The other 3 channels are the same like channel 1.For the corresponding address space checking, please have a reference of the address form.

| Project | variable | Significance:DOSi(BYTE2, BYTE1, BYTE0) |
| :---: | :---: | :---: |
| Switch value output 1 | DOS1 | BYTE2(0~225), alarm project,1~26 correspond electricity address table corresponding to the 26 electrical quantities low alarm; and greater than 128(129~154)into a corresponding high alarm, data formats are the same as MODBUS address information table in power information description. Note that the decimal point position information. |
| Switch value output 2 | Dos2 |  |
| Switch value output 3 | Dos3 |  |
| Switch value output 4 | Dos4 |  |

### 8.1 Examples

8.1.1Switch value input function:

The switch module has the collecting function for 4 channels switch input. When collecting is inputed the signal, the instrument's LED screen may display"-1 open" or "-0 closed". This is used as the local supervisor for the switch signal.Change the instrument to the display status of the switch information, the last four digits of the lowest row on the LED screen display the status information of switch input. From the left to the right,it is channel 1 ,channel 2,channel 3 and channel 4 . With the RS 485 interface, the users can transmitting the switch register's information to the remote computer's terminal. The picture on the right shows:Channel 4,3 and 1
 are on;Channel 2 is off.
8.1.2 Switch value output function:

The picture shows the channel 1 and 4 is closed; channel 2 and 3 is open. The another function of the switch value output module is off-limited alarm output.Set the range for the parameters. When the parameter is off-limited the range, the correspondingswitch value output interface is open,the screen will display 1 . When the signal is in the range, the screen will display 0 . Programming example:For the instrument $10 \mathrm{KV} / 100 \mathrm{~V}, 400 \mathrm{~A} / 5 \mathrm{~A}$, set the DO 1 as $\mathrm{UA}>11 \mathrm{KV}$ alarm, DO 2 as $\mathrm{IA}>400 \mathrm{~A}$ alarm, DO 3 as $\mathrm{PF}<0.9$ alarm, DO 4 as $\mathrm{F}>51.00 \mathrm{HZ}$, the controlling word should be:

The setting for switch value parameters DOI can also be realized via key programming. In the programming operation, menu DOSI item's parameter is the corresponding DOI parameter.See the right picture:The first line showing DO-1 means the item setted is switch value output module 1 ;Line 2 showing 0007 is the alarm item,7:IA low alarm.Line 3 showing 2000 means the area of the alarm, when the $\mathrm{IA}<2000$, DO1 output alarm signal, as relay is open.

Switch value output and analog quantity output electric quantity parallel table

| Project | Switch value output |  | analog quantity output |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Corresponding <br> parameter <br> (lower alarm) | Corresponding <br> parameter <br> (higher alarm) | Corresponding <br> parameter <br> (0~20mA) | Corresponding <br> parameter <br> $(4 \sim 20 \mathrm{~mA})$ |

| SS(Total apparent power) | 25 | 153 | 25 | 153 |
| F(frequency) | 26 | 154 | 26 | 154 |

Alarm parameter calculation method:
Numerical calculation of electrical parameters of alarm limits: take the range 's highest value 4 number, get a 4 bit integer ratio. The alarmValue and range of values is equal to a set value and reference value ratio.

Set value $=\frac{\text { Alarm value } \times \text { Reference value }}{\text { Range value }}$
If the instrument's parameters are $400 \mathrm{~V}, 800 \mathrm{~A} / 5 \mathrm{~A}$

| Setting requirements | Alarm condition | Range value | Reference value | Programming parameters |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Electricity parameters | Set value |
| Voltage alarm | UA>400V | 400 | 4000 | 129 | 4000 |
|  | UB>430V |  |  | 130 | 4300 |
|  | UC<80V |  |  | 3 | 800 |
| Current alarm | $\mathrm{IA}>800 \mathrm{~A}$ | 800 | 8000 | 135 | 8000 |
|  | IB<400A |  |  | 8 | 4000 |
|  | IC $<70 \mathrm{~A}$ |  |  | 9 | 7000 |
| Power alarm | PA>320KW | 320K | 3200 | 138 | 3200 |
|  | PS>980KW | 960K | 9600 | 141 | 9800 |
|  | PS<560KW |  |  | 13 | 5600 |
| Power factor alarm | PFA>0. 866 | 1 | 1000 | 146 | 866 |
|  | PFS>0. 9 |  |  | 149 | 900 |
|  | PFS<0. 5 |  |  | 21 | 500 |

## Chapter 9. Analog transmitting output module

The instrument can offer the function of four-channel analog transmitting output. Each channel can choose to set any of the 26 parameters, with the instrument's function for analog transmitting output module, to reach the function of parameter 's analog transmitting output ( $0-20 \mathrm{~mA} / 4-20 \mathrm{~mA}$ ). The corresponding relation can be set at random.
9.1 Parameter:output 0-20mA, 4-20mA,class:0.5

Overload: $120 \%$ effective output,the maximum current: 24 mA , the maximum volt: 16 V
Load:Rmax $=400 \Omega$
9. 2 Application example

For 10KV/100V,400A/5A instrument settings: AO1-UA:0~10KV/4~20mA; AO2-IA:0~400A/4~20mA;AO3-PS:0~12MW/0~20mA AO4-QS:0~12MVar/0~20mA.

| Classification | Analog transmitting <br> output | Control word ( high byte first) |  |
| :---: | :---: | :---: | :---: |
|  |  | BYTE1 |  |
| Analog transmitting output1 | UA:4~20mA | $128+1=129$ | 1000(03HE8H) |
| Analog transmitting output2 | IA:4~20mA | $128+7=135$ | $4000(0 \mathrm{FHAOH})$ |
| Analog transmitting output3 | PS:0~20mA | 13 | $1200(04 \mathrm{HBOH})$ |
| Analog transmitting output4 | QS:0~20mA | 17 | $1200(04 \mathrm{HBOH})$ |

The electrical parameters of transmitting output values are calculated from range: the top 4 bits of the number, a 4 bit integer ratio. Then the transmitting value and range value ratio is equal to the set value and reference value ratio

Set value $=\frac{\text { Transmitting value } \times \text { Reference value }}{\text { Range value }}$
Note: when the transmission value errors, modify the corresponding set value.

| Setting requirements | Transmission condition | Range value | Reference value | Programming parameters |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Electricity parameters | Set value |
| Voltage transmitting | UA:0~400V/4~20mA | 400 | 4000 | 129 | 4000 |
|  | UB:0~420V/4~20mA |  |  | 130 | 4300 |
|  | UC:0~350V/0~20mA |  |  | 3 | 3500 |
| Current transmitting | IA:0~800A/0~20mA | 800 | 8000 | 7 | 8000 |
|  | $1 \mathrm{~A}: 0 \sim 800 \mathrm{~A} / 4 \sim 20 \mathrm{~mA}$ |  |  | 135 | 8000 |
|  | IB:0~900A/4~20mA |  |  | 136 | 9000 |
| Power transmitting | PA:0~320KW/0~20mA | 320K | 3200 | 10 | 3200 |
|  | PS:0~960KW/4~20mA | 960K | 9600 | 141 | 9800 |
| Power factor transmitting | PFA:0~1/0~20mA | 1 | 1000 | 18 | 1000 |
|  | PFS:0~0.9/4~20mA |  |  | 19 | 900 |

The users may set the parameters for the transmitting output via the plate key-pressing setting.In the programming operation AOSI menu item is the transmitting module parameter setting parameter See the right picture for parameter setting, programming item AO-1:transmitting output channel 1 $0129=128+1$ : choose the UA as $4-20 \mathrm{~mA}$ as the transmitting output, and the corresponding volt for 20 mA is 10 KV ,setting as 1000 .

For example, in the internet $10 \mathrm{KV} / 100 \mathrm{~V}$, the transmitting output function is finished as:transmitting output loop 1,UA:0-10KV/4-20mA.

## Chapter 10. FAQ and Solutions

10.1 About the inaccuracy measuring for the U,I,P and so on

Firstly, the users have to be sure that the right volt and current signal have already reach to the instrument. The users may use the multimeter to test the volt signal, or if needed, use pincerlike meter to test the current signal. Secondly,make sure the connecting of the signal line is correct, for example the leading-in interface for the current signal;check each phase sequence is right. The instrument can view the power display, only if the reverse electricity input, the active power will be in minus while the active power symbol will be plus if the instrument used normally. If the active power symbol is minus, it may means the wrong connecting for current leading-in line or the wrong connecting of the phase sequency.Another thing should be noted that the electricity value the instrument displayed is primary Grid values. If the set for the PT and CT rate of the instrument is different from the actual used rate, the instrument may also display the wrong electricity value.
10.2 About the inaccuracy energy read,energy data not saved

The energy accumulated value of the instrument is based on the power measuring.Check firstly whether the instrument's powe value is conforming to the actual load. The instrument support the bidirectional energy computation. With the wrong connecting and minus total active power, the energy will accumulateto the reverse active energy and the positive active energy not. The problem appearing most is the wrong connecting for the CT leading-in line and leading-out line. If the energy data fails to be saved, please check whether there is any load for the instrument. Counting the load, the instrument will keep accumulating.
10.3 The instrument isn't lighting

Make sure suitable auxiliary power (AC/DC $85-265 \mathrm{~V}$ ) has already added to the instrument's auxiliary power interface.The volt Make sure suitable auxiliary power (AC/DC $85-265 \mathrm{~V}$ ) has already added to the instrument's auxiliary power interface. The volt value of the auxiliary power.If the power volt tests fine and there is nothing displayed on the screen of the instrument, the users may consider about cutting off the electricity and connecting it again. If the instrument still doesn't display normally, please contact with our technical department.
10.4 About RS 485 communication, there is no returning data from the instrument

Firstly,make sure the instrument's communicating setting information,such as the slave device's address, baud rate,checking ways is confirming to the core device. If there is more than one instrument that doesn't have the data returned, please check the connecting of main communicating line is right and also the RS 485 converter works fine. If there is only one instrument or few instrument communicate exceptionally, the users should also check the relevant communicating lines. Excluding or confirm the core device software problem with the way to modify the exception situation and slave device address. Or excluding or confirm the instrument problems with the way of testing the exception and instrument installation address.
